SUMMARY

Backend engineer for ten years, now IT Development Manager at The Body Shop Indonesia. In late 2025 I started building with coding agents instead of by hand, and most of my work since then has gone into making that safe at production scale: the ticket and TDD rules the agents follow, a subagent roster covering our 15 services, and the knowledge base they read before they act. I still ship code every week, mostly Next.js, NestJS and Go, plus LLM features for internal tools. Looking for a remote AI engineering role where the delivery pipeline itself is part of the product.

HOW I GOT HERE WITH AI

Nov 2025	Started with Augment Code on our NestJS services. The first few weeks were mostly finding out how agents break: wrong test runner, stale context, three different browser tools across three repos. That is where the standards work began.
Dec 2025 – Feb 2026	Moved to Claude Code as the daily driver and shipped the first LLM features to production in Staff Center: receipt OCR with a vision model, then a separate categorizer and a claim validator, all through OpenRouter. The model for each feature lives in a config table, so swapping Haiku for Grok on one job is a row update rather than a deploy. If the model fails, the claim still goes through and a person categorises it.
Mar 2026	Wrote the Icarus orchestrator: 21 subagents, one per service, each with its own instruction file. Built a smaller fleet of seven for Staff Center, including a meta-agent whose only job is to recalibrate the others when they drift. The Obsidian vault became the thing agents read first.
Apr – Jun 2026	Turned habits into rules. Jira frozen; tickets are markdown files in git. No implementation until a failing test is committed and its hash is in the ticket. Under those rules I shipped Inventory Health Report, the Stock Adjustment Platform and the storefront rebuild, mostly alone, with 739, 413 and 215 commits under my name.
Jun 2026 – now	Added Paseo to run agents in parallel. Since July the main job has been porting be-api-inventory from NestJS to Go, 249 endpoints, with golden tests recorded from the live service so every response stays byte-identical. Each phase gets an adversarial review before merge. Cutover is per path behind Traefik, with the old service still answering anything not yet ported.

CORE SKILLS

AI / Agentic Eng.	Claude Code, custom subagents and instruction files, MCP, Augment Code, Paseo (multi-agent orchestration), OpenRouter multi-model integration (Anthropic, xAI, Google, Zhipu), LLM vision OCR, prompt and model config management, golden-test evaluation, agent knowledge bases (Obsidian)
Backend	Go, TypeScript / Node.js (NestJS), Java (Spring Boot, Quarkus), Python (FastAPI), REST, GraphQL (Yoga), Kafka, Redis
Frontend	Next.js (App Router), React, Tailwind CSS, shadcn/ui, Core Web Vitals work
Data	PostgreSQL (partitioning, TypeORM), MongoDB, Elasticsearch, MSSQL data warehouse, Oracle retail ERP, Supabase
Infra / DevOps	Kubernetes (EKS), Docker, Jenkins CI/CD, Traefik, AWS, Keycloak (OIDC / RBAC), Ansible
Practices	TDD, spec-driven development, strangler-fig migrations, engineering standards, code review, leading a team of four

EXPERIENCE

IT Development Manager · The Body Shop Indonesia	Aug 2025 – Present · Tangerang
Run a team of four and the Icarus retail platform: e-commerce, POS and inventory across about 15 microservices and four frontends in Next.js and Flutter. I set the engineering rules and still ship code.	
- Designed the AI-native workflow the team works in: subagent roster per service, file-based tickets in git replacing Jira, and a gate that requires a failing test commit before any implementation. - Built and maintain the knowledge base agents read before acting: 5,000+ notes and 370+ SQL recipes across PostgreSQL, MSSQL and two Oracle ERP instances. House rules: no secrets, no PII, no raw transcripts. - Wrote the GenAI engineering standards, including one browser-automation tool for every coding agent after we found Playwright, Puppeteer and Cypress each in use in a different repo.	

- Porting the inventory service from NestJS to Go on my own (249 endpoints, 4 modules). Target is roughly 90% less memory, from 1.5 GiB across 8 pods to about 0.3. Strangler-fig by module, byte-for-byte parity checked against live traffic. Published a reusable Keycloak library for Go along the way.
- Ship as an individual contributor; see projects below.

Senior Backend Developer · The Body Shop Indonesia

- Backend for Icarus: inventory, product and commerce services in NestJS on PostgreSQL, MongoDB and Kafka. Kubernetes on EKS, Jenkins for CI.
- Wrote most of the Java middleware (OTP, notifications, marketplace) in Spring Boot and Quarkus. Built the Go scheduler that syncs Shopee orders: webhooks, fulfilment and pickup slots, dead-letter queue, retries.
- Integrations with the Oracle retail ERP and the MSSQL warehouse. Keycloak auth and RBAC across services.

Mar 2021 – Jul 2025 · Tangerang

Web Developer · PT Neo-Fusion Indonesia

- Java and Spring Boot for client web applications.
- From 2020, main author (around 390 commits) of The Body Shop Indonesia's Spring Boot backend on AWS: products, customers, orders, S3, LDAP. That project is how I ended up joining TBSI in 2021.

Mar 2016 – Feb 2021 · Jakarta (intern Sep 2015 – Feb 2016)

SELECTED PROJECTS (commit counts from git)

Petty Cash AI Claims System, Staff Center

Stores and HQ submit receipts, the system reads them, finance approves. I wrote the AI parts and the fraud checks. OCR with a vision model (PDF pages rendered to images first), a separate categorizer call, a validator that checks the claim description against active categories, and a three-tier auto-categoriser that learns merchant mappings over time. Fraud detection is five layers and none of them is an LLM: SHA-256, perceptual hash, receipt number, transaction fingerprint, behaviour. Multi-step approvals with SLA escalation. 15 tables, 13 API groups.

Next.js 16 · React 19 · Supabase · OpenRouter (Claude, Grok, GLM-vision) · sharp · Jest · Playwright MCP

Feb 2026 · sole author, 67 commits

Inventory Health Report, SCM analytics

Supply chain used to rebuild a near-expiry / slow-mover / dead-stock view in Excel every time they needed one. This replaces it: a daily snapshot job into partitioned PostgreSQL, 13 months of history, filters by store, region, brand and category, Excel and CSV export, refresh on demand with a throttle. Nine phases, backend and frontend.

NestJS · PostgreSQL (partitioned) · Chart.js · Kubernetes CronJob · Redis

May 2026 · sole author, 739 commits

Stock Adjustment Platform

Before this, correcting stock meant an UPDATE on the ledger table. About 80,000 orphaned rows had built up with no actor or reason attached. The new engine takes single entries or a bulk Excel upload, requires a reason from a master list, writes the ledger atomically and keeps a full audit trail. Later inventory-correction features were built on top of it.

NestJS · PostgreSQL · TypeORM · Oracle ERP sync

Apr 2026 · primary author, ~71% of 413 commits

Storefront product pages and Core Web Vitals

Mobile product pages had no add-to-cart button. Listing pages had their filters commented out. Rebuilt both (sticky mobile CTA, faceted filters, better search, richer cards) and released dev, preprod and production together. Then several rounds on Core Web Vitals: server-rendered hero, fetchpriority hints, lazy modals, SWC minify. Started from mobile LCP 3.3 s and TBT 880 ms.

Next.js · TypeScript · Lighthouse / PageSpeed Insights
